Students learn to use hardware description languages and computer-aided design tools (simulation, circuit synthesis) and apply them to the design of a variety of digital circuits. Circuits are simulated and prototyped in the lab, allowing students to see how abstract design concepts can be translated into real,

underlying logic system that drives electronic circuit board design. Digital logic is the manipulation of binary values through printed circuit board technology that uses circuits and logic gates to construct the implementation of computer operations. Digital logic is a common part of electrical engineering and design courses.
