General relativity explains the law of gravitation and its relation to other forces of nature. It applies to the cosmological and astrophysical realm, including astronomy.

When there is no gravity present, then the metric coefficients  $\langle g_t \rangle$  and  $\langle g_x \rangle$  converge back to 1, and we say that the space is "flat," giving us once again special relativity. Of course the "hard part" of general relativity is determining how the metric coefficients arise from what we already know is the

relativity couldn't have happened without an earlier theory. The theory of relativity that Einstein put forth in 1905—which is now known as the special theory of relativity—describes how lengths in space and durations of time are different to observers moving at different speeds, in different frames of reference.
